

Techdom & code • Chapter 1

How techdom tools work

Last checked 3 November 2026 • 9 minutes to read

A techdom tool automates something a platform already offers, then wraps it in a character, a sound and a game. This chapter shows how the main families work, what each one takes from you, and why they break.

Verified | Vivian's field notes | Unverified

This chapter is not advice for your situation.

In 30 seconds

- Most techdom tools automate one plain job: buying a gift, liking a post, opening a page.
- The craft is in the wrapper, which is the character, the sound and the game around the payment.
- Each family takes something different from you: money, attention, or control of a machine.
- Tools break whenever the platform changes, and a silent break can charge the wrong amount.

- The usual danger is a tool that works exactly as built, with a hidden total or no exit.

You will learn

- The main tool families and what each one does under the hood.
- What one cycle of an automatic gift tool looks like.
- How a wheel or a gacha-style wrapper turns a payment into a game.
- Why tools break, and what to retest after a change.
- Which tools reach into your accounts or your machine, and why those need the most care.

I am a drawn character who has watched many tools run. Each one does a single plain job, and the rest is costume. This chapter lifts the costume so that you can see the job, and what the job asks you to hand over.

— **Vivian**

What a techdom tool is

Techdom is findom in which a tool acts for the dom, with the sub's agreement and a stop that always works. ◑ The kink and its limits are in Techdom. This chapter covers the machinery.

Almost every tool automates something that already exists on a platform: buying a gift from a wishlist, liking a post, opening a page. The tool adds a character, a sound and a game. The payment part is simple, and most of the maker's hours go into the wrapper. ◑

A tool usually reaches you as a folder or a zip, loaded into the browser by hand, with a short readme and a promo picture. Chrome requires the extensions it lists to disclose how they handle user data. Verified A tool loaded by hand is not in that listing, so its promises rest on the maker's word alone.

Three things a tool can take

The families differ in what they take from you. Money, attention and control of your machine are three different things, and the list runs from the least to the most.

The main families

	What it does	What it takes from you	What breaks it
Automatic gift buyer	Buys gifts from a wishlist on a repeating cycle once started	Money, through your saved card	A changed wishlist page; a bank step
Auto-liker	Likes and reposts a dom's posts from your own social account	Attention, and your account's standing	A changed site; a flagged account
Wheel or spin	A spin lands on an amount, then you are sent to pay it	Money, one prompt at a time	A recreated item; a wrong link

	What it does	What it takes from you	What breaks it
Gacha-style	Each pull triggers a real purchase and returns a card	Money, hidden inside a collection game	The purchase step; a hidden total
Hub	One app that bundles several tools, a gallery and chats	Whatever its parts take, in one place	One flaw reaches every copy
Remote or screen tool	Lets another person see or drive your screen	Control of your machine	The connection; your own trust

The wheel is also called a spin. A gacha tool counts each pull as one draw. The scene calls the first two kinds autodrain and autodrone. Both are generic scene words for a kind of tool, not the name of any one product, and both can fit inside a hub. Other tools exist on the edges: blockers that keep you off a page, and rebrand links that change your profile to a dom's look after you authorise an app. The rebrand link is harder to build than it looks.

One cycle of an automatic gift tool

An automatic gift buyer is a browser extension that works inside your own signed-in session. Once started, it buys items from the dom's wishlist on a repeating cycle while the page stays open, and a good one keeps its running totals on your computer only. It needs your real name shown as the sender and a card saved at checkout, because a gift nobody can credit cannot be thanked. That also ties your legal identity to adult purchases made on an account that someone else controls.

One cycle, in plain words

1. **Start**

   You press the master switch. Nothing is bought before that.

2. **Wait**

   The tool pauses for a time its maker chose.

3. **Buy**

   It asks the platform for one gift, using your signed-in session and your saved card.

4. **Bank**

   If your bank wants a verification, a careful tool waits for you. A careless one does not.

5. **Confirm**

   The tool counts the gift only when the platform confirms the order.

6. **Count**

   The running total goes up and the cycle starts again.

7. **Stop**

   A failure, an unknown outcome or a press on stop ends the loop.

The wait is the main control. In tools of this kind a full cycle lasts roughly 20 to 35 seconds, and other extensions use waits of about 3 to 10 seconds. Worked out,

USD 10.00 every 30 seconds is USD 1,200.00 in one hour. The shorter the wait, the less time you have to notice what is happening.

Most tools offer a few fixed buttons: a standard amount, a cheaper one for people with less money, and a special one that changes how the payment or the first messages behave. Fixed small amounts keep each click small and quick. Read what every mode does before you start. A mode meant to be switched on only after several sends have gone through is a staged escalation, covered in Safe design.

The wheel and the gacha-style wrapper

A wheel tool turns a payment into a spin. You spin, the landing number is an amount, and a prompt sends you to the matching item on the dom's wishlist to pay it. A rare low result can switch on a special mode, with a changed theme, extra pop-ups and a respin where only higher amounts can come up.

Each amount has to be tied to a wishlist item. A tool that finds items by name breaks on a rename or an automatic page translation, so careful makers store a direct link per amount. Links break too. A link that changed after a wishlist was rebuilt can charge a wrong amount without any warning. A silent mismatch like this costs real money, in either direction.

A gacha-style tool wraps the same purchase in a collection game. Each pull silently triggers a real purchase, so the card you receive depends on which gift was bought. The name is used mostly because everyone knows it. Variants include buying gems first at set prices, rarity tiers with shiny duplicates, and a waiting screen whose pop-up images hide how long the purchases take.

What you see and what you pay

	What may happen underneath	What to ask
A multiplier such as 10x	The real total swings from a few dollars to hundreds	Is the total shown before the charge?
A waiting animation	Several purchases run behind it	How many purchases, and at what price each?
A cheap pull	A card that disappears unless you keep paying	What is the full cost over a month?
A collection game	Progress stored only inside the tool	What happens to my cards if I uninstall?

The wishlist was recreated

A dom recreated her wishlist items this morning. A spin tool that worked last week is about to run tonight. What do you do first?

A Start it, because it worked last week

Not this one. Last week proves nothing. A recreated item can leave an old link pointing somewhere else.

B Ask whether every option was retested, with the amount shown set against the amount charged

The right answer. Right. A broken link fails silently, and the wrong amount can be charged.

C Check only the biggest slice

Not this one. One wrong link is enough. Every option has to be tested after any change.

Tools that reach into your accounts or machine

An auto-liker acts inside your own social account. It likes or reposts the dom's posts while you do something else. Everything it does is done as you. If the platform flags the pattern, your account carries the consequence, not the dom's. Whatever the maker promises, the platform's rules apply to your account and the risk is yours.

A hub bundles several tools in one app. When it also offers remote actions, such as making accounts follow, post or send, one flaw reaches every installed copy. Anyone who finds such a flaw should tell the maker and never use it.

A remote or screen tool is the highest-risk family. Some of these tools are built around consent: one connection from your computer to a server, a one-time request that reaches you, and nothing travels until you accept inside the

program. Even so, a remote tool is a grant of trust to a stranger, and this wiki does not recommend it.

Red flags

A request to open a remote session

- You are asked to approve full control of your computer.
- You are asked to block your own keyboard and mouse, or to read out a connection code.
- The request comes at a moment of trust or pressure, with the words “so I can see for myself”.

Counter. Say no and close the app. A US federal alert advises people not to give control of a computer or phone to a stranger. Verified A remote-access vendor advises users not to give device access to anyone they do not know or trust. Verified Full control exposes your files, saved passwords and accounts, and it is also how many scams begin. Plain written answers serve almost every purpose. See Check a tool before you install it.

Why tools break, and who builds them

Wishlist platforms change their pages often and keep patching the gap that automatic buying uses, so a tool can stop working for days. The purchase step is the part that keeps breaking, especially when card verification may or may not

appear. Different tools break at different points, so one tool working says nothing about another.

The browser adds its own limits. Chrome stops a Manifest V3 extension service worker after 30 seconds without activity. Verified Events and extension API calls reset those timers, so a background script cannot be assumed to run continuously. Verified

The bank's confirmation can reload the page, and a naive script then starts the payment again. A careful tool keeps a waiting-for-confirmation state instead of rerunning. Test builds make it worse. A test switch that skips the payment page and is left on in a shipped build is a risk to everyone who runs it.

I have not checked what any wishlist platform's terms say about automated buying. Read them before you install anything. Unverified

Some makers float ways to hide the adult layer from a card processor. I do not describe them. They break the processor's terms, and the usual outcome is a frozen balance or a closed account tied to a real identity.

Myth

If a tool worked yesterday, it is safe today.

Fact

A platform change or a new build can break it overnight, and a break can charge the wrong amount instead of nothing.

Myth

A tool that works for one person works for everyone.

Fact

A fault can show for one user only, such as a freeze at checkout when a payment fails, and a phone browser can behave differently from a desktop one.

Myth

A polished tool is a tested tool.

Fact

Polish is the wrapper. A tool can now come from a short brief to an AI assistant, and testing is the part that gets skipped.

Vivian's field notes

In my experience, makers watch each other's tools, and ideas are copied within weeks. Many tools are built one per dom, because in my experience many doms cannot code. A running tool is also marketing: a short video of a send landing brings messages that pictures alone do not.

The nature of the job explains the risk. A tool that holds your signed-in session and your saved card, runs unattended and shows no running total removes the natural pause between decisions. The only brake left is a cap you set before you started. That is the subject of Safe design.

If a tool already holds your money or your session, go to If you already sent. If spending has become hard to stop, go to Where to get help.

The families in one line

Automatic gift buyer

Buys gifts on a loop from your signed-in session. It takes money.

Auto-liker

Likes and reposts as you. It takes attention and puts your account at risk.

Wheel

A spin picks an amount, then you pay it. Retest every link after any change.

Gacha-style

Each pull is a real purchase. Ask for the total before the charge.

Remote tool

Another person drives your machine. Treat it as a red line.

Remember it

1. A techdom tool automates one plain job and wraps it in a game.
2. Money, attention and control of your machine are three different things to hand over.
3. Tools break when a platform changes, and a silent break can charge the wrong amount.
4. Retest every option after any change, with the amount shown set against the amount charged.
5. Never give remote control of your computer to anyone.

Check it

Every claim with its evidence level and its sources.

Evidence levels

Verified	Checked against the original source.
Reported	Stated by a serious secondary source read in full.
Community	Widely said in the scene; no document proves it.
Vivian's field notes	First-hand experience, not a study.

Unverified — Plausible, not proven yet.
