

Becoming a dom • Chapter 3

Stay anonymous

Last checked 3 November 2026 • 9 minutes to read

A drawn face cannot be leaked, but files, names, accounts, tools and payments can. This chapter shows where the person behind a persona is exposed, where anonymity ends, and why access to your accounts is never part of the game.

Verified | Reported | Vivian's field notes | Unverified

This chapter is not advice for your situation.

In 30 seconds

- A drawn persona is anonymous toward the audience. It is not anonymous toward the payout.
- Only the persona's name belongs in anything you produce. Clean every file, then check it.
- Small public fields, game names and wishlist names connect accounts.
- A real dom never needs a password, a login code or a remote session.

- If it leaks, stop, secure, keep proof and ask for help.

You will learn

- Who can learn who you are, and by which route.
- How to clean files and sites, and how to check a tool before you run it.
- Which public fields and names give a person away, for doms and for subs.
- Why anonymity ends where the money lands.
- What to do when a login request, a threat or a leak arrives.

A drawn face cannot be leaked. Everything else about the person behind it can. I keep the two apart on purpose, and I check the second more often than the first.

— Vivian

What you hide, from whom

Anonymity in 2DFD is real and narrow. It works well toward the audience: a drawn face cannot be leaked, a clean file carries no coordinates, and a pseudonymous account shows no name. Compared with classic findom, the drawn character removes the face and the voice from the deal, and the risk moves to payment platforms, social platforms and the tools used to move money.

Some doms report being targeted by people who threaten them with fake explicit pictures made to look like them. Such threats frighten even when the

pictures are known fakes. A drawn character has no real face to fake, which is a real layer of protection.

Secrecy has a cost. In a study of findommes, participants named secrecy among the most negative aspects of the work. Verified Keep at least one person you trust who knows what you do.

Who could learn who you are

	How you can leak	What helps
Subs	A bio line, a game name, a name on a wishlist	Public fields that agree with each other and hold no real-life detail
Platforms	Phone checks, linked accounts, file metadata	Clean exports, one purpose per account
Payment company	Identity papers and a bank account	Accept it, and plan for it from the start
Family or employer	A chat left open, a shared computer	A separate profile, a locked screen
Other doms	A name seen on two pages, a handle found in a file	A handle you accept being recognised by

This map comes from my own experience, not from a study.

Files, sites and tools

Only the persona's name appears in anything you produce: files, file names, commits, metadata and screenshots. Never a personal name, a mail address or a system path that contains a user name.

Images carry traces: positions, colour profiles, comments, provenance records, prompts stored in text chunks and extra bytes. Videos carry a date, the name of the program and the name of the encoder. Clean every export, then reread the file and refuse the export if anything remains. Cleaning is needed even when you start clean, because an encoder can add a profile by itself. Test the checker with odd cases, because a hidden note placed in an unexpected spot once slipped through mine. Treat every picture as copyable too, since anyone can take a screenshot.

Publish an image

1. Export the file from your tool.
2. Strip it: location, profiles, comments, prompts and extra bytes.
3. Reread the stripped file and compare it with a clean sample.
4. If anything remains, stop and fix the cause, not the file.
5. Only then post it.

A site leaks through its own plumbing. Serve everything from the site's own host, with no third-party fonts, trackers or scripts, so that only the host sees a

visit. Audit it from the outside: old versions of a site can stay reachable at hosting addresses you forgot. New adult-themed domains can be flagged early by browser safety filters, so test the name and keep a backup.

Code leaks too. Author commits under the persona's name and in UTC, because a local time offset shows where the author lives. Create a code-hosting account with a pseudonym for both the name and the e-mail, because every change stays in the history. A tool you hand to others carries no name, no signature and no default picture. Strip the source, comments and leftover handles first, or someone can repackage it with something added.

Secrets never travel through a chat. Type a token or key into a masked prompt in your own terminal, never into a commit, screenshot or message, and send access keys privately so that they can be revoked.

A tool can be harmless in code and still unsafe in practice. Check what it sends and to whom, check its defaults and not only its screen, and test it in a virtual machine with no personal network. Do not run an unknown program on your main computer. Avoid any tool that builds an identifier from the computer name or the account name. A safer design starts with everything off, a whitelist, a random identifier, a short history and a control channel by invitation.

Anonymous confession features are anonymous only toward other members. The platform and the host still hold the data.

Accounts, names and public fields

Public fields leak more than files. A single careless bio line on a related account can show that the person behind a persona is not who the persona says. A game or stream name that resembles the persona's name, or points back to an old dispute, can do the same. Read every public field of every linked account as a stranger would.

Operators often run several accounts. Platform terms may forbid multiple accounts or a new account opened after a ban, and a second account puts the

first at risk. Unverified Do not borrow another person's phone number for a check. It drags an uninvolved person into adult activity.

Do not confirm or explain links between personas. When asked who a persona's contacts or secondary identities are, deflect. Never link a handle you found in a tool's files to a persona in public unless the person said so in their own words, because that is doxxing. Exposing a bad actor also invites retaliation, such as mass reports from accounts the rival controls. If you show a mentor or a peer anything, show the persona account and never the personal one.

Purging messages and blocking contacts separates the persona from the person, and it also destroys learning material. Deleting chats after every send is a different matter, because it can be a sign of the spiral. See The spiral.

If you are a sub

Names of senders can be visible on a public wishlist, and doms look at each other's pages. Use a handle you are comfortable having seen by several doms. Keep a separate account for adult servers, and check who else is in a server before you join, because a mutual server can expose you. Lock the screen or close the chat on a shared computer, and use a separate profile.

Your name, your address, your workplace and your family are a legitimate boundary. A dom who needs them is not playing a game. Physical gifts break anonymity in both directions, so the safe default is no addresses, or a neutral forwarding or retail service.

Money is the weak point

Anonymity ends at the payout. In my experience a card processor or an adult payment company ties the persona to a legal identity: identity documents, a business registration and a bank account in the company's country. An account

opened in a real name carries any ban with it, and the ban follows the real person.

The persona is a mask toward the audience and the platforms, never toward the money rail. Partial or false details at a processor do not give anonymity. They lead to closed accounts and held funds, and a sub's payment can vanish with them. The authors of a study of findommes flag fraud, including identity fraud, as a remaining risk in this field. Verified

A persona's tools hold no names, mail addresses or cards. A card stays with the processor. Test any payment flow with a fake provider first, then in the provider's test mode with its published test cards, and type a real key only in your own terminal. For the full picture, see Getting paid.

Myth

A drawn persona makes everything around her anonymous.

Fact

It protects the face and the voice. The payout, the small public fields and the tools you run still point to a person.

Myth

Disposable cards and partial details get around a processor's checks.

Fact

They lead to closed accounts and held funds, and the account follows the real identity.

Access is never part of the game

A real dom never needs your password. Passwords and one-time codes are keys to your identity, and a spoken promise is not a safeguard. A US cybersecurity alert advises people not to hand control of a computer or phone to a stranger. Verified A remote-access vendor states that it does not offer remote support services, so a caller claiming to be its support is not genuine. Verified

In this scene the same request appears inside the game. Press reports describe some doms blackmailing subs. Reported A first-person account says threats of exposure are a common punishment from financial doms. Reported A login handed over as a gesture of trust is a control gesture, and a fake dom would make exactly the same request.

Vivian's field notes

I track how these requests are phrased. The language of trust and the language of a scam overlap completely. When someone says a password proves you are serious, the request itself is the red flag, whatever the intention. A dom who means well does not need your password, and one who does not will say the same words.

Red flags

Access requests

- A dom asks for your password as proof of honesty.
- A dom asks for the one-time code just sent to your phone or e-mail.
- A dom asks for a remote desktop session “to supervise”, and adds that you can always quit.
- A dom logs you out of your own accounts, or keeps them open “for you”.
- A dom asks for access as the price of forgiveness.

Counter. Say no once, calmly. Offer a screenshot or an export instead. If you already shared anything, change the password and sign out of every session. Do not argue.

Pressure around privacy

What they say or do

1 “Prove you are honest: give me your login.”

The counter

A login proves nothing and opens everything. Refuse and show a screenshot instead.

What they say or do

2 “Why would you want to do this alone?”

The counter

Demanding a reason for privacy makes you defend a normal boundary. Say it once: “because I want it” is enough.

What they say or do

3 “I only want access because I care.”

The counter

Wanting access to someone’s account because it feels special is a control pattern. Decline.

What they say or do

4 “That dom is not who she says she is. Leave her.”

The counter

Exposing someone to win you away isolates you. Ask why identity is the argument.

The same rule runs the other way. Giving anyone, even a trusted mentor, full access to the account where your subs talk is risky. The subs cannot speak freely, and the helper can step into conversations. If you share access, tell the subs, exclude named conversations, and remove the helper’s sessions when trust drops.

A dom asks for a code

You sent a tribute and told a dom you also pay others. She says you can prove honesty by reading out the code that just arrived by text, and promises to do nothing harmful. What do you do?

A Refuse, offer a screenshot, and change your passwords if you shared anything before

The right answer. Right. A code opens your account to whoever has it. A promise is not a safeguard.

B Read the code, since she promised to do nothing harmful

Not this one. The promise cannot be checked, and the code cannot be taken back.

C Give her your password instead of the code

Not this one. A password is the larger key. The same rule applies.

When it leaks

Rumours and screenshots travel fast. A rumour that a dom is secretly a sub can cost her subs, and private images can spread through a shared server before an apology arrives. ◑ Keep private images and chats out of any shared space.

If your identity leaks

1. Stop. Do not confirm or deny a real-life detail.
2. Secure your accounts: change passwords and sign out of every session.
3. Save proof with dates before you block anyone.
4. Report the account to the platform. Do not pay a blackmailer and do not send more material.
5. Tell one person you trust, and read Where to get help.

Never hand over

Password
Never. A real dom never needs it.

One-time code
Never. It opens your account.

Address
Not without a neutral forwarding service.

Card number
Never. The card stays with the processor.

Check yourself

Question 1 of 2

Where does anonymity end for a dom?

- ◯ At the bio
- ◯ At the payout
- ◯ At the first post

Answer. At the payout. A processor ties the persona to a legal identity.

Question 2 of 2

A dom says a reason is needed for your privacy. What is it?

- ◯ A fair question
- ◯ A pressure pattern
- ◯ A required form

Answer. A pressure pattern. A boundary needs no proof.

Remember it

1. Only the persona's name goes into anything you produce.
2. Clean every file, then check it.
3. Public fields and game names connect accounts.
4. Anonymity ends at the payout.
5. A real dom never needs your password or a code.
6. If it leaks, stop, secure, keep proof and ask for help.

Check it
