

Variants • Chapter 2

Techdom

Last checked 3 November 2026 • 8 minutes to read

Techdom is domination carried out by tools: software that sends, likes, locks or takes over, with the sub's agreement and a stop he controls. This chapter says what it is, who wants it, and where consent ends.

Verified | Reported | Vivian's field notes

This chapter is not advice for your situation.

In 30 seconds

- Techdom means a tool does part of the dominating, with the sub's agreement given beforehand and a stop he can use at any moment.
- A tool can take three things from you: money, attention or control of your machine. The further down that list, the more you hand over.
- Doms like it because it earns while they are away. Subs like it because it removes the decision, and that is also its main danger.
- Remote control of your computer is the highest-risk offer, and the request follows the pattern of a common scam.

- Trust a tool for its visible limits, never for the dom's word.

You will learn

- What techdom means in this wiki, and which tools it covers.
- Why doms build tools and why subs ask for them.
- What a remote session really hands over, and how to refuse one.
- What consent looks like inside a tool, and which pressure designs to refuse.

A machine can hold the rules, and that is the only version of this I would trust: an amount, a limit and a way out, written down where nobody can bend them. When a tool lacks those three, it is a trap with a theme, and this chapter is here so you can tell the two apart.

— Vivian

What techdom is

techdom is the part of 2DFD where a tool does the dominating. The dom sets the rules, and software on the sub's own computer, phone or accounts carries them out. Typical examples are an extension that sends gifts by itself and one that likes and reposts the dom's posts from the sub's own account. Others are an app that sets his wallpaper or locks his device, and a live session in which the dom drives his screen.

Some creators use the word more loosely, for any corner of the scene where a person builds something with technology instead of only talking. This wiki uses the narrow meaning, because it is the one that can be made safe: a tool acts for

the dom, the sub agreed beforehand, and a stop that he controls works at every moment.

Handing a decision to someone else and to a machine is a fantasy that adults may choose. Done well, a machine can show the rules in numbers. Done badly, the machine removes the pause in which a person changes his mind.

What a tool can take from you

	What it does	What you hand over	The question to ask
Auto-send tool	Buys gifts from a wishlist on a repeating cycle	Money, and the decision each time	Who enforces my cap, and where is it kept?
Auto-engage tool	Likes and reposts the dom's posts from your social account	Attention, and the standing of your account	What happens to my account if the platform objects?
Device control	Sets a wallpaper, locks a phone or a computer	Control of a device	Can I end it at once, for free?
Remote session	The dom sees and drives your screen	Everything that is open on the machine	Can I end it myself, and what is on my screen right now?

The list runs from least to most. The further down you go, the more you give up, and the more a cap and a stop matter. How each family works is in How techdom tools work, and the rules a safe tool follows are in Safe design.

Why doms build it and why subs ask for it

For a dom, a tool lets subs pay without her being present. Chasing sends around the clock can earn more, but it costs all of her time. A dom may also find it exciting to wake up to a batch of silent sends that arrived overnight. For some doms, watching a sub send is itself the kink, and a live chat can run beside a tool that sends in the background.

For a sub, giving up the decision is the point. Once he presses start, he no longer chooses. Some subs describe the draw as the thrill of giving up control of their finances. Reported

Tools also sell on arousal more than on polish, which is why you judge the limits of a tool and not its pitch. Success is visible: a post showing a tool running or a send landing brings messages, where pictures alone bring little. Ideas are copied quickly, and the real advantage is the reach of the account that promotes a tool.

Vivian's field notes

The feature that makes a tool exciting is that nobody has to decide again. It is also what makes it dangerous. A decision made once, while aroused, becomes a stream of payments that nobody watches, and friction is the only thing that gives a person time to change his mind. When I see a silent send that repeats with no message, I read it as a reason to ask how he is, not as a win.

Sessions through a screen

A remote session is sold as a private session. The dom connects to the sub's computer, sometimes for hours, and may change his wallpaper, watch him play, or act as him on his accounts. The usual request is that the sub approves full control and blocks his own keyboard and mouse, removing his ability to interrupt. Everything open on the machine is in view: files, saved passwords, mail and chats.

This is the highest-risk offer in techdom, and it matches a known fraud pattern. Public agencies advise people not to give control of a computer or phone to a stranger. Verified A remote-access vendor states that it provides no remote support services, so callers claiming to be its support are not genuine, and it advises against giving device access to anyone you do not know or trust. Verified A dom who asks you to open remote software, even as a joke, is making the request a scammer would make.

Red flags

A remote-access request is a red flag when

- It comes from someone you met recently, or late in a long, warm chat.
- It arrives as a joke, a dare or a test of trust.
- It asks you to read out a connection code, or to install software you did not look up.
- It asks you to block your own keyboard and mouse.
- It will run while you are away from the screen.

Counter. Say no to the remote part and offer screenshots, or a shared screen that you can end yourself. They serve almost every purpose, and nobody who plays fair needs more.

Refusing costs nothing, and these steps keep the stop in your hands.

How to refuse a remote session

1. Say no to remote control in plain words, however warm the chat has been. Nobody who plays fair needs it.
2. Offer screenshots instead, or a shared screen that you start, limit to one window and end yourself.
3. Never install remote-access software because someone asks, and never read out a connection code.
4. Never agree to block your own keyboard and mouse. Blocked input removes your stop.
5. If you already gave access, end the connection yourself, remove the program, change any password that was visible on screen, and read Where to get help.

What consent looks like in a tool

Consent to a tool is set before the session, in plain terms, and can be withdrawn. Agreement given in the moment is weak: one press account asks whether it is really consent when a client is too aroused to think straight about taking on debt. ◎ Reported Consent covers only what the sub knew the tool would do, and a tool that does more has gone beyond the agreement.

Access is never part of the game. Press interviews note that some doms ask for debt contracts or control of a sub's bank accounts. ◎ Reported A tool can be a quicker version of the same hand-over.

Trust should rest on design, not on the dom's word. Whoever runs a tool can act on what it reaches at any moment. A trustworthy techdom shows visible limits, an emergency stop, a record of what the tool can see, and nothing that can act without the sub. For a browser extension, the Chrome Details page shows which sites it may read and change, so you can look before you press start. Verified The full check is in Check a tool before you install it.

A tool that respects consent usually has these marks:

- It arrives switched off, and it does one named thing on one named site.
- You set the cap before you start, and something other than the page you are looking at enforces it.
- A running total is always visible, and a payment counts only when it is confirmed.
- A stop is always on screen, works in every state of the tool, and costs nothing.
- Any control program has a quick exit, such as a shortcut or a button, and a safety word agreed beforehand.
- A command that you did not accept inside the program never runs.
- A trigger, such as a sound that you were taught to obey, has an agreed way to be switched off.

The design rules behind this list are in Safe design.

Pressure that comes with the tool

What they say or do

1 A setting that locks the off switch, so that uninstalling is the only way out

The counter

Do not turn it on. A lock you cannot undo is a trap, and uninstalling is a last resort, not a stop.

What they say or do

2 Any device lock whose exit costs money

The counter

An exit that you pay for is not an exit. Keep to tools you can close for free.

What they say or do

3 A hidden total, or a random price you cannot see before the charge

The counter

Ask for the price first. If the total cannot be seen, lower your cap or walk away.

What they say or do

4 A tool that announces each run publicly, so stopping becomes visible and the dom can see who runs it and how often

The counter

Public tallies make stopping visible, and that makes it harder. Ask for private runs.

What they say or do

5 A chain of share links that drafts a post under your own name, each draft more committed than the last

The counter

Read every draft before you publish. It goes out on your own account, so stop at the first draft you would not sign.

What they say or do

6 A mode that gets crueller or dearer as you pay more, or switches on after a few sends

The counter

Intensity scaled to your wallet is pressure. Decide your limits before you start.

What they say or do

7 Ad copy that sells a tool as costless, leaving the reader no reason to refuse

The counter

A free tool still costs whatever it sends. Look at the cap, not at the price tag.

What they say or do

8 Liking and reposting at speed from your own account

The counter

The platform may restrict your account, and the cost lands on you, not on the dom. ◑

Safe design often means earning less, and the market rewards the opposite. A persona who ships a tool without a cap and a stop is selling a trap with a theme.

Myths about tools

Myth

A techdom tool only affects my computer.

Fact

A tool that acts through your accounts or your card reaches the services tied to them. Your social account can be limited, your bank sees every payment, and a remote session reaches whatever is open.

Myth

If I trust the dom, I do not need limits.

Fact

Trust in a person is not a limit. A cap, a wait and a stop work whether or not the person deserves your trust.

Myth

Silent sends mean a happy sub.

Fact

A recurring send with no message may be a tool running unwatched. Check in before you enjoy it.

Myth

I can always close the program, so I need no stop.

Fact

Closing the window is the last resort. A tool needs a visible stop, a pause and a cap of its own.

Late in a long chat

A dom you have talked to for hours suggests a private session through remote-access software. She says she will take care of everything, and that you should block your own keyboard and mouse so that nothing interrupts. What do you do?

A Decline the remote part, and offer screenshots or a shared screen that you can end yourself

The right answer. Correct. Blocked input removes your stop, and a remote session reaches everything open on the machine. Almost every purpose is served without it.

B Accept, because you have chatted for hours and trust her

Not this one. Hours of chat build warmth, not safety. Trust in a person is not a limit, and the request matches a common scam pattern.

C Accept, but only on your work laptop

Not this one. A work machine holds other people's data and may be forbidden to share. Remote control is the problem on any device, and the blocked input removes your stop.

What a tool takes, and what protects you

Money

A tool that buys gifts on a cycle. A cap set in advance, kept outside the page, and a stop that works at once protect you.

Attention

A tool that acts on your social account. The platform may restrict your account, and the cost is yours.

Control of a machine

A lock, a wallpaper app or a remote session. Keep your own keyboard and mouse, and keep a quick exit.

Consent

Given beforehand, in plain terms, covering only what you knew, and withdrawable at any moment.

Stop

Visible, free, and tested in every state of the tool.

If spending already feels hard to stop, see The spiral and Where to get help before you install anything.

Remember it

1. Techdom is a tool that dominates with your agreement beforehand and a stop that you control.

2. A tool can take money, attention or control of your machine. Ask what it takes before you press start.

3. A remote session reaches everything open on the screen. Refuse blocked input and refuse any request from a stranger.

4. Trust visible limits: a cap held outside the page, a free stop, and a total you can see.

5. A silent send that repeats is a reason to check in.

Check it

Every claim with its evidence level and its sources.
